

Identification of Unknown Organic Compounds

**Workbook to Accompany
Organic Chemistry Courses**

Introduction

This workbook is designed to train organic students in the art of spectral interpretation. A detailed discussion of the theory of spectroscopy (and spectrometry for MS) may be found in most organic textbooks and that material should be studied before attempting the problems.

There are tables of data (correlation tables) which are used to interpret aspects of each spectrum. These are included as appendices in the back of the book.

Each compound is an "Unknown" and the spectral data are included: infrared (IR); nuclear magnetic resonance (NMR), both proton and ^{13}C . Although not a spectroscopic technique, the low resolution mass spectrum (MS) is also included.

Problem Solving—The Strategy

There are four spectra for each compound:

1) **The Mass Spectrum**-This is a low resolution spectrum of the fragmentation patterns, resulting from the electron ionization of the compound. The molecular formula is also included on this page; by using the index of hydrogen deficiency, it is possible to determine the number of rings and/or double bonds in the compound.¹ The IHD does not distinguish rings *from* multiple bonds, but does indicate the total numbers of rings *and* multiple bonds. The mass spectrum itself, is a listing of the masses for the fragments, resulting from the ionization of the compound.

2) **The Infrared Spectrum**-This spectrum shows the vibrational frequencies of different types of bonding in an organic compound. This data is used to determine the *functional groups* present in the compound. There is a table of common vibrational frequencies in reciprocal centimeters (cm^{-1}) in Appendix B.

3) **The ^1H NMR**-this is used to determine the locations and the types of protons in the structure. The integration of the proton types is included on the spectra. The integration is the simplest ratio of *types of protons* in the structure; always cross check with the molecular formula to be sure that all the protons have been assigned. There is a correlation table of chemical shift values in Appendix C.

4) **The ^{13}C NMR**-analogous to proton NMR: this spectrum reveals the different types of carbon in the compound. These are the standard decoupled ^{13}C NMR spectra; there is also a correlation table of ^{13}C chemical shift data in appendix D.

¹ IHD = (#Hs saturated Hydrocarbon) – (#Hs in the compound) / 2

Suggested Steps:

Use the mass spectrum and the molecular formula to determine structural sub-groups. The IR spectrum is used to determine the functional groups in the compound. On a separate worksheet, write down the molecular “pieces.” It is also helpful to subtract these atoms from the molecular formula to determine how much of the structure is left. The ^1H NMR is the most valuable for determining the structure (including isomers). Begin assembling the subgroups and pieces to build a possible molecule. The NMR will indicate where, and how many protons are possible. At this point, there will be very few structures which are consistent with the data. The ^{13}C NMR will indicate the **types** of carbon atoms (not how many). Combining all the information from all the spectra, propose (draw) a structure. Go back to each spectra and test for consistency- all the spectral data will be consistent with the proper structure. The list of all unknowns is included on the last page of the appendix.

Appendices

A. Natural Abundance of Isotopes for selected Elements

Element	Symbol	Nominal Mass	Exact Mass	Abundance
Hydrogen	H	1	1.00783	99.99
	D or ² H	2	2.0141	0.01
Carbon	¹² C	12	12	98.91
	¹³ C	13	13.0034	1.09
Nitrogen	¹⁴ N	14	14.0031	99.6
	¹⁵ N	15	15.0001	0.37
Oxygen	¹⁶ O	16	15.9949	99.76
	¹⁷ O	17	16.9991	0.037
	¹⁸ O	18	17.9992	0.2
Fluorine	F	19	18.9984	100
Silicon	²⁸ Si	28	27.9769	92.28
	²⁹ Si	29	28.9765	4.7
	³⁰ Si	30	29.9738	3.02
Phosphorus	P	31	30.9738	100
Sulphur	³² S	32	31.9721	95.02
	³³ S	33	32.9715	0.74
	³⁴ S	34	33.9679	4.22
Chlorine	³⁵ Cl	35	34.9689	75.77
	³⁷ Cl	37	36.9659	24.23
Bromine	⁷⁹ Br	79	78.9183	50.5
	⁸¹ Br	81	80.9163	49.5
Iodine	I	127	126.9045	100

B. Characteristic Absorptions for various Functional Groups in IR Spectra

<i>Functional Group</i>	<i>Absorption(s) (cm⁻¹)</i>	<i>Comments</i>
Alkyl C-H Stretch	2950 - 2850 (m or s)	Alkane C-H bonds are common and are not usually diagnostic; however, the demarkation of 3000 cm ⁻¹ should be noted: aliphatic C-H are below this value.
Alkenyl C-H Stretch	3100 - 3010 (m)	Absorption peaks above 3000 cm ⁻¹ are frequently diagnostic of unsaturation
Alkenyl C=C Stretch	1680 - 1620 (v)	
Alkynyl C-H Stretch	~3300 (s)	Absorption peaks above 3000 cm ⁻¹
Alkynyl C≡C Stretch	2260 - 2100 (v)	
Aromatic C-H Stretch	~3030 (v)	
Aromatic C-H Bending	860 - 680 (s)	Hydrogen-Bonded Hydroxyl display an intense, broad "U" shaped appearance.
Aromatic C=C Bending	1700 - 1500 (m,m)	
Alcohol/Phenol O-H Stretch	3550 - 3200 (broad, s)	This OH stretch paired with a C=O ~ 1780-1710 cm ⁻¹
Carboxylic Acid O-H Stretch	3000 - 2500 (broad, v)	
Amine N-H Stretch	3500 - 3300 (m)	Primary amines produce two N-H stretch absorptions, secondary amides only one, and tertiary none.
Nitrile C≡N Stretch	2260 - 2220 (m)	The carbonyl stretching absorption is usually one of the strongest in the spectrum. It is also one of the most common.
Aldehyde C=O Stretch	1740 - 1690 (s)	
Ketone C=O Stretch	1750 - 1680 (s)	
Ester C=O Stretch	1750 - 1735 (s)	
Carboxylic Acid C=O Stretch	1780 - 1710 (s)	
Amide C=O Stretch	1690 - 1630 (s)	
Amide N-H Stretch	3700 - 3500 (m)	As with amines, an amide produces zero to two N-H absorptions depending on its type.

C. Chemical Shifts for ^1H NMR

Type of Hydrogen	Chemical Shift (δ)	Type of Hydrogen	Chemical Shift (δ)
$(\text{CH}_3)_4\text{Si}$	0 (by definition)	$\begin{array}{c} \text{O} \\ \\ \text{RCOCH}_3 \end{array}$	3.7-3.9
RCH_3	0.8-1.0	$\begin{array}{c} \text{O} \\ \\ \text{RCOCH}_2\text{R} \end{array}$	4.1-4.7
RCH_2R	1.2-1.4	RCH_2I	3.1-3.3
R_3CH	1.4-1.7	RCH_2Br	3.4-3.6
$\text{R}_2\text{C}=\text{CRCHR}_2$	1.6-2.6	RCH_2Cl	3.6-3.8
$\text{RC}\equiv\text{CH}$	2.0-3.0	RCH_2F	4.4-4.5
ArCH_3	2.2-2.5	ArOH	4.5-4.7
ArCH_2R	2.3-2.8	$\text{R}_2\text{C}=\text{CH}_2$	4.6-5.0
ROH	0.5-6.0	$\text{R}_2\text{C}=\text{CHR}$	5.0-5.7
RCH_2OH	3.4-4.0	ArH	6.5-8.5
RCH_2OR	3.3-4.0	$\begin{array}{c} \text{O} \\ \\ \text{RCH} \end{array}$	9.5-10.1
R_2NH	0.5-5.0	$\begin{array}{c} \text{O} \\ \\ \text{RCOH} \end{array}$	10-13
$\begin{array}{c} \text{O} \\ \\ \text{RCCCH}_3 \end{array}$	2.1-2.3		
$\begin{array}{c} \text{O} \\ \\ \text{RCCCH}_2\text{R} \end{array}$	2.2-2.6		

D. Chemical Shifts for ^{13}C NMR

Carbon Type	Chemical Shift (δ)	Carbon Type	Chemical Shift (δ)
RCH_3	10-40		110-160
RCH_2R	15-55	RCOR	160-180
R_3CH	20-60	RCNR_2	165-180
RCH_2I	10-40	RCOH	165-185
RCH_2Br	25-65	RCH	180-215
RCH_2Cl	35-80	RCR	
R_3COH	40-80		
R_3COR	40-80		
$\text{RC}\equiv\text{CR}$	65-85		
$\text{R}_2\text{C}=\text{CR}_2$	100-150		

D. Index of Unknowns

Unknown #	NAME	Page
1	Toluene	3
2	Diethyl Ether	7
3	Methyl Acetate	11
4	Ethyl Acetate	15
5	Cyclohexane	19
6	Methylcyclohexane	23
7	Isobutyl Acetate	27
8	Isopropyl Acetate	31
9	Ethyl Benzene	35
10	Isopropyl Benzene (cumene)	39
11	Ethanol	43
12	Acetic Acid	47
13	Propionic Acid	51
14	Methyl Propionate	55
15	n-Propyl Propionate	59
16	n-Propyl Acetate	63
17	1-Propanol	67
18	2-Butanol	71

20	2-Bromopropane	79
21	2-Propanol	83
22	Acetophenone	87
23	Benzoic Acid	91
24	Benzaldehyde	95
25	Methyl Benzoate	99

Unknown #	NAME	Page
26	Phenyl Acetate	103
27	Methyl Phenyl Ether (anisole)	107
28	Phenyl Ethylene (styrene)	111
29	n-butyraldehyde	115
30	iso-butyraldehyde	119
31	2-butanone	123
32	cyclohexene	127
33	3-pentanone	131
34	3,3-Dimethylbutyric Acid	135
35	Cyclohexanone	139
36	1-chloropentane	143
37	3-methyl-2-butanone	147
38	1-methyl-1-cyclopentene	151
39	m-Ethyltoluene	155
40	Cyclohexanol	159
41	2-Phenyl-2-butanol	163
42	1-Methylcyclopentanol	167
43	Bromobenzene	171
44	3-hexanone	175
45	Benzyl Bromide	179
46	Phenol	183
47	p-Bromonitrobenzene	187
48	m-Bromonitrobenzene	191
49	Nitrobenzene	195
50	m-Nitrobenzoic Acid	199
